

CarePod | Workplace Wellness & Emotional Recovery Concept

Problem

Modern workplaces are designed around productivity but often lack private spaces for emotional recovery. Employees experiencing stress, frustration, grief, anxiety, or emotional overload are typically left with limited options, such as suppressing emotions, leaving the workplace, or using inappropriate spaces like restrooms for privacy.

Approach

Conceptualized CarePod, a human-centered workplace wellness initiative that repurposes existing office rooms into dedicated spaces for emotional decompression. The idea focuses on providing employees with a safe and private environment where they can pause, reflect, regain composure, and process emotions without judgment, using existing infrastructure rather than requiring specialized hardware.

Potential Applications

Corporates, startups, hospitals, universities, and public institutions seeking to improve employee well-being and foster psychologically safe environments.

Key Areas Explored

Workplace wellness, human-centered design, systems thinking, organizational behavior, psychological safety, and scalable process design.

Skills Demonstrated

Systems Thinking, Problem Identification, Human-Centered Design, Strategic Thinking, Research & Documentation, Process Design, Workplace Innovation.

Proposed Features

- Sound insulation and privacy
- Comfortable seating and ventilation
- Occupancy indicator
- Emergency accessibility
- Simple, low-cost implementation using existing office spaces
